Is it possible to specify different paddings for different sides?	Difference between Margin and Padding?	What is use of the "Opacity"?	What is use of the "Z-Index"?
4/16/2012 19:33:26	M.S. Ramachandran	No	Selecting the elements are called selectors. We can select elements by its Id, class,attributes.	ramachandran.muruga@dci.in	absolute position : It starts from left: 0px and top:0px relative position means it ll be positioned relatively to the last element fixed position means it ll be fixed in a window even when we scroll it remains in the same position.	don know	don know	A[title~="attribute"]	Scroll-bar is added to see the rest of the content							if we use float left the elements will be arranged from left... if we set float right the elements will be arranged from right	TRUE	TRUE	Margin is the space between the boundary and the element padding is the space within the element	opacity is used to increase/decrease the transparency of the web page. opacity ranges from 0 - 1	Z index is used to pop up the screen
12/17/2020 21:01:24	Nilesh	Yes	Selectors	njaswantrai@ebintl.com	Postion	test	test	A[title]	The rest of content will be removed from DOM object							test	TRUE	TRUE	test	test	test
4/16/2012 19:50:08	Anoj Kumar	Yes	Selectors are used to select an element or attirbutes. There are different types of selectors like: Universal selector, type selector, attribute selector, class selector etc. Universal selector is used to select all an element from the class. We use asterisk(*) for the indication of universal selection. Attribute selector can be used to select an element on the attribute basis. Class selector can be used to select an element on the basis of class name like - .intro class or .address class.	anoj.siwraj@dci.in	Absolute position - In this positioning method, image will be fitted according to window size. Fixed position -- In this positioning method, image will be fitted as per the actual image.	Background-repeat property is used to define the repeatation for an image. If we have setted the background-repeat property for an image then that particular image will be repeatedly use in background for any particular element.	No idea	A[title~="attribute"]	Scroll-bar is added to see the rest of the content							Floating is used for the image position. If we have setted the float property to left the image will be display in left side. If we have setted the float property to right the image will be display in right side. We can also set the float property as "none".	TRUE	TRUE	Margin is used to set the margin for an element from Top, right, bottom and left side. We can set the margin value in px, pt and cm. Ex - margin {10px} means all four margin values are 10px(top,right, bottom,left) Padding is used to define how padding should be for an element from top, right, bottom and left. We denotes padding also in the form of px, pt and cm. Ex - padding {10px 20px} means top and bottom padding is 10px while left and right padding is 20px.	Opacity means clarity or opaquness. It is used for the clarity purpose. By using the Opacity we can define the clarity of the image.	Z-index is used in the case of positions. Suppose we have use the positioning like relative or absolute or fixed, in this case Z-index is used to how much portion of the window is overflows.
